

# HOW LARGE A ROLE SHOULD INDUSTRIAL ENERGY SAVINGS AND ELECTRIFICATION PLAY IN THE DANISH ENERGY POLICY MIX?

Henrik Klinge Jacobsen & Mattia Baldini  
Technical University of Denmark

42nd IAEE International Conference  
Montreal June 1, 2019

# Industrial energy consumption in Denmark

- Relatively low energy intensity
- Diverse composition of resources
- Low taxation
- Ambitions to reduce fossil fuel consumption
- Fossil fuel reduction options in use of natural gas

# Energy intensity in manufacturing [ENERGY/GDP]

# Composition of industrial energy demand: Savings and electrification

- Composition of final demand (2012)
  - Electricity 29%
  - Fossil fuels 55%
  
- End use savings and electrification – hourly profiles
  - Electricity savings follow electricity demand profile
  - Electrification of natural gas follow gas demand profiles
  
- Construction of profiles depending on variability of demand: 1-2-3 shift consumption mode
  - 3 shift mode is probably stable and 2 shift less stable
  - Savings of electricity more valuable if unstable – 1 and 2 shift industries
  - Electrification of gas (fossil) demand most attractive if stable – 3 shift

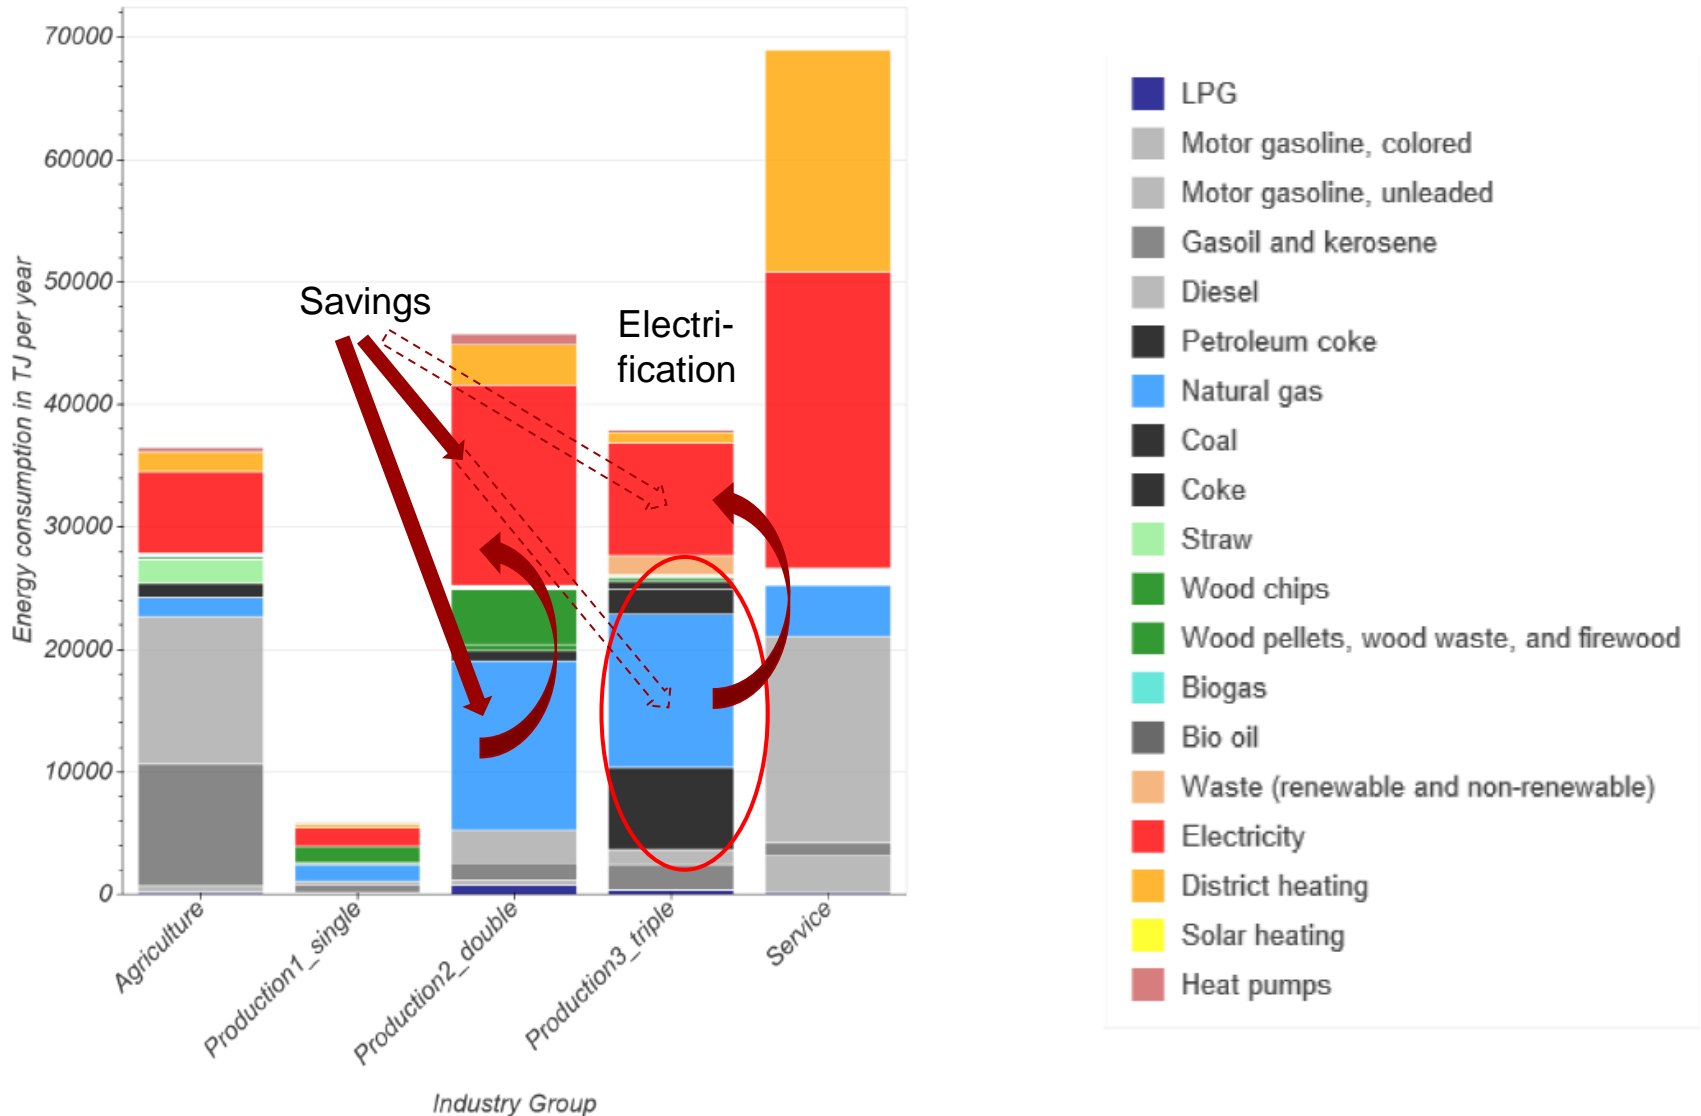

# DTU Savings and electrification targets

Based on 57 sub-sectors, 22 end-uses and 20 fuels (Source: Wiese F, Baldini M Pathways to Carbon Neutral Industrial Sectors: Integrated Modelling Approach with High Level of Detail for End-use Processes 12<sup>th</sup> SDEWES Conference, Dubrovnik 2017)

Final energy use in different Danish industry groups by fuel based on data for 2012

# DTU Savings and electrification

Final energy use in different Danish industry groups by fuel based on data for 2012

# Composition of final fuel demand – fossil share still 51%

**Manufacturing final energy consumption 2017**  
**- Around 9% of CO<sub>2</sub> in DK**

# Total industry – fuel density per fuel type and end-use (94 PJ)

(Source: Wiese F, Baldini M Pathways to Carbon Neutral Industrial Sectors: Integrated Modelling Approach with High Level of Detail for End-use Processes 12<sup>th</sup> SDEWES Conference, Dubrovnik 2017)

# Value of savings and cost of electrification in power system

*Time profile of savings (electricity) and profile of natural gas electrification impacts electricity system savings and additional system costs differently*

# Electricity demand - Sum of profiles compared to the total electricity demand in a sample week (week 07, 2012).

Data for total electricity demand in DK

# Process heating fuel demand (natural gas) for a full week

Source: Wiese F, Baldini M Pathways to Carbon Neutral Industrial Sectors: Integrated Modelling Approach with High Level of Detail for End-use Processes 12<sup>th</sup> SDEWES Conference, Dubrovnik 2017

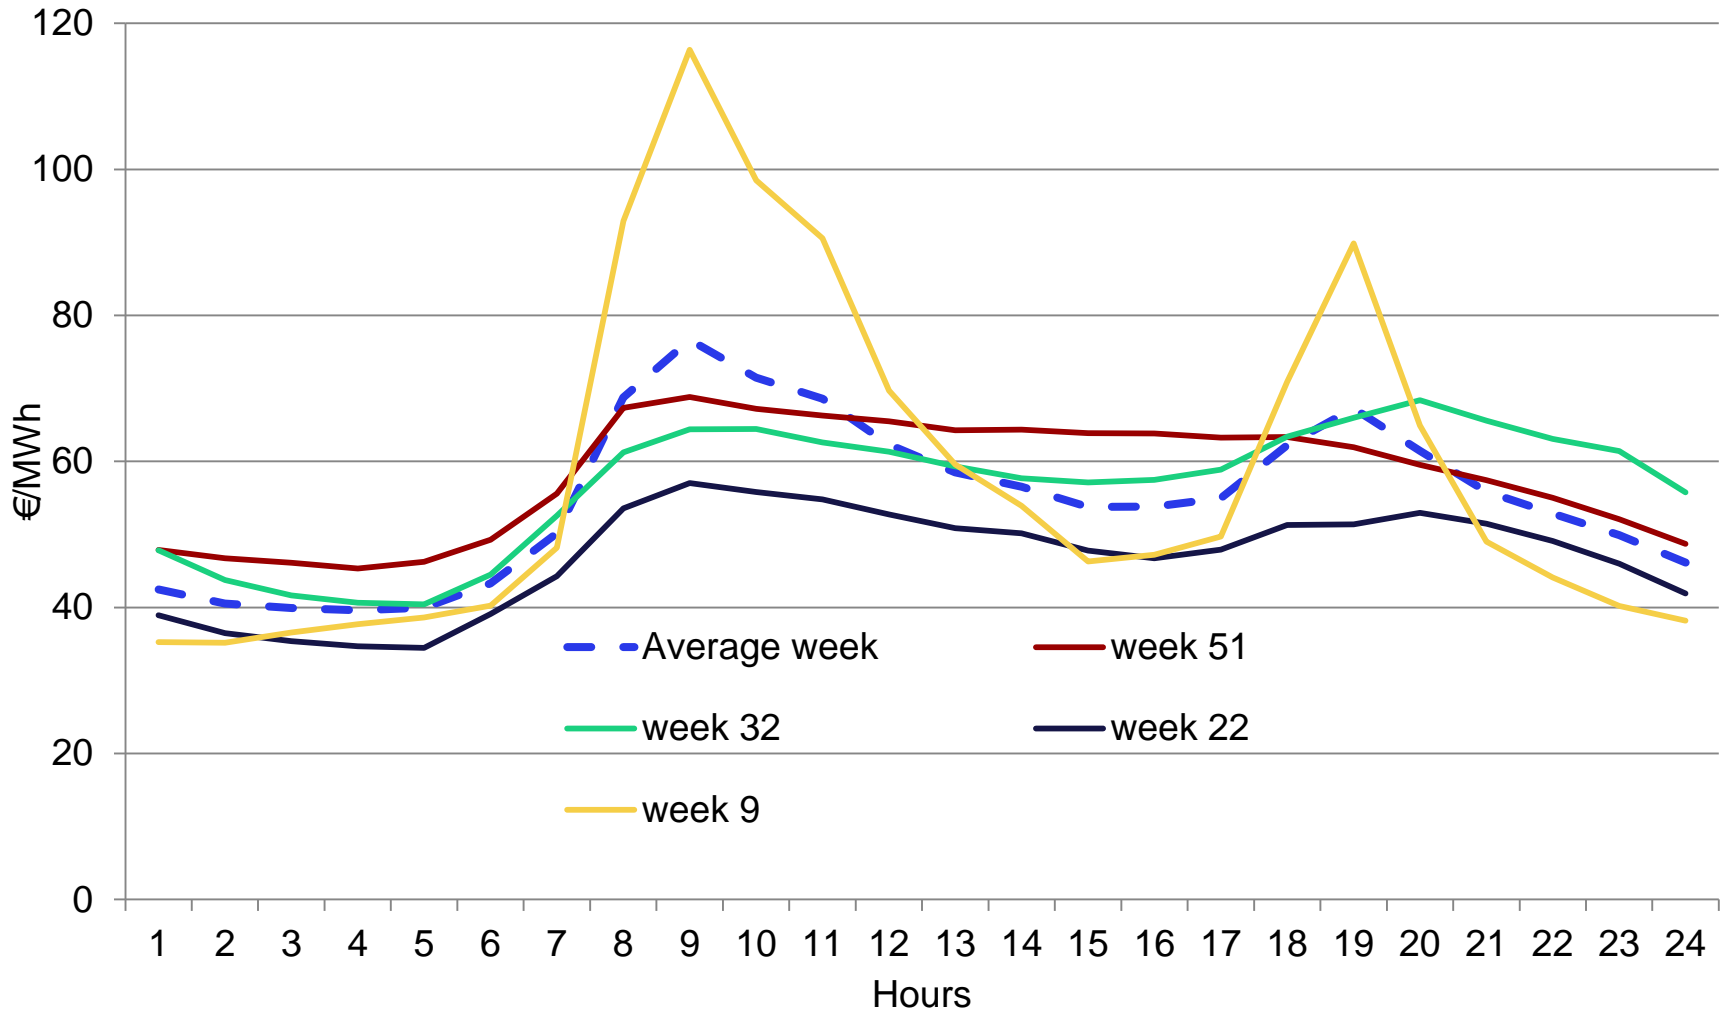

# Electricity price profiles – Balmorel model outputs

**DTU** Electricity price profiles 5 working days average over 4 weeks – (actual prices 2018)

DK-east 2018

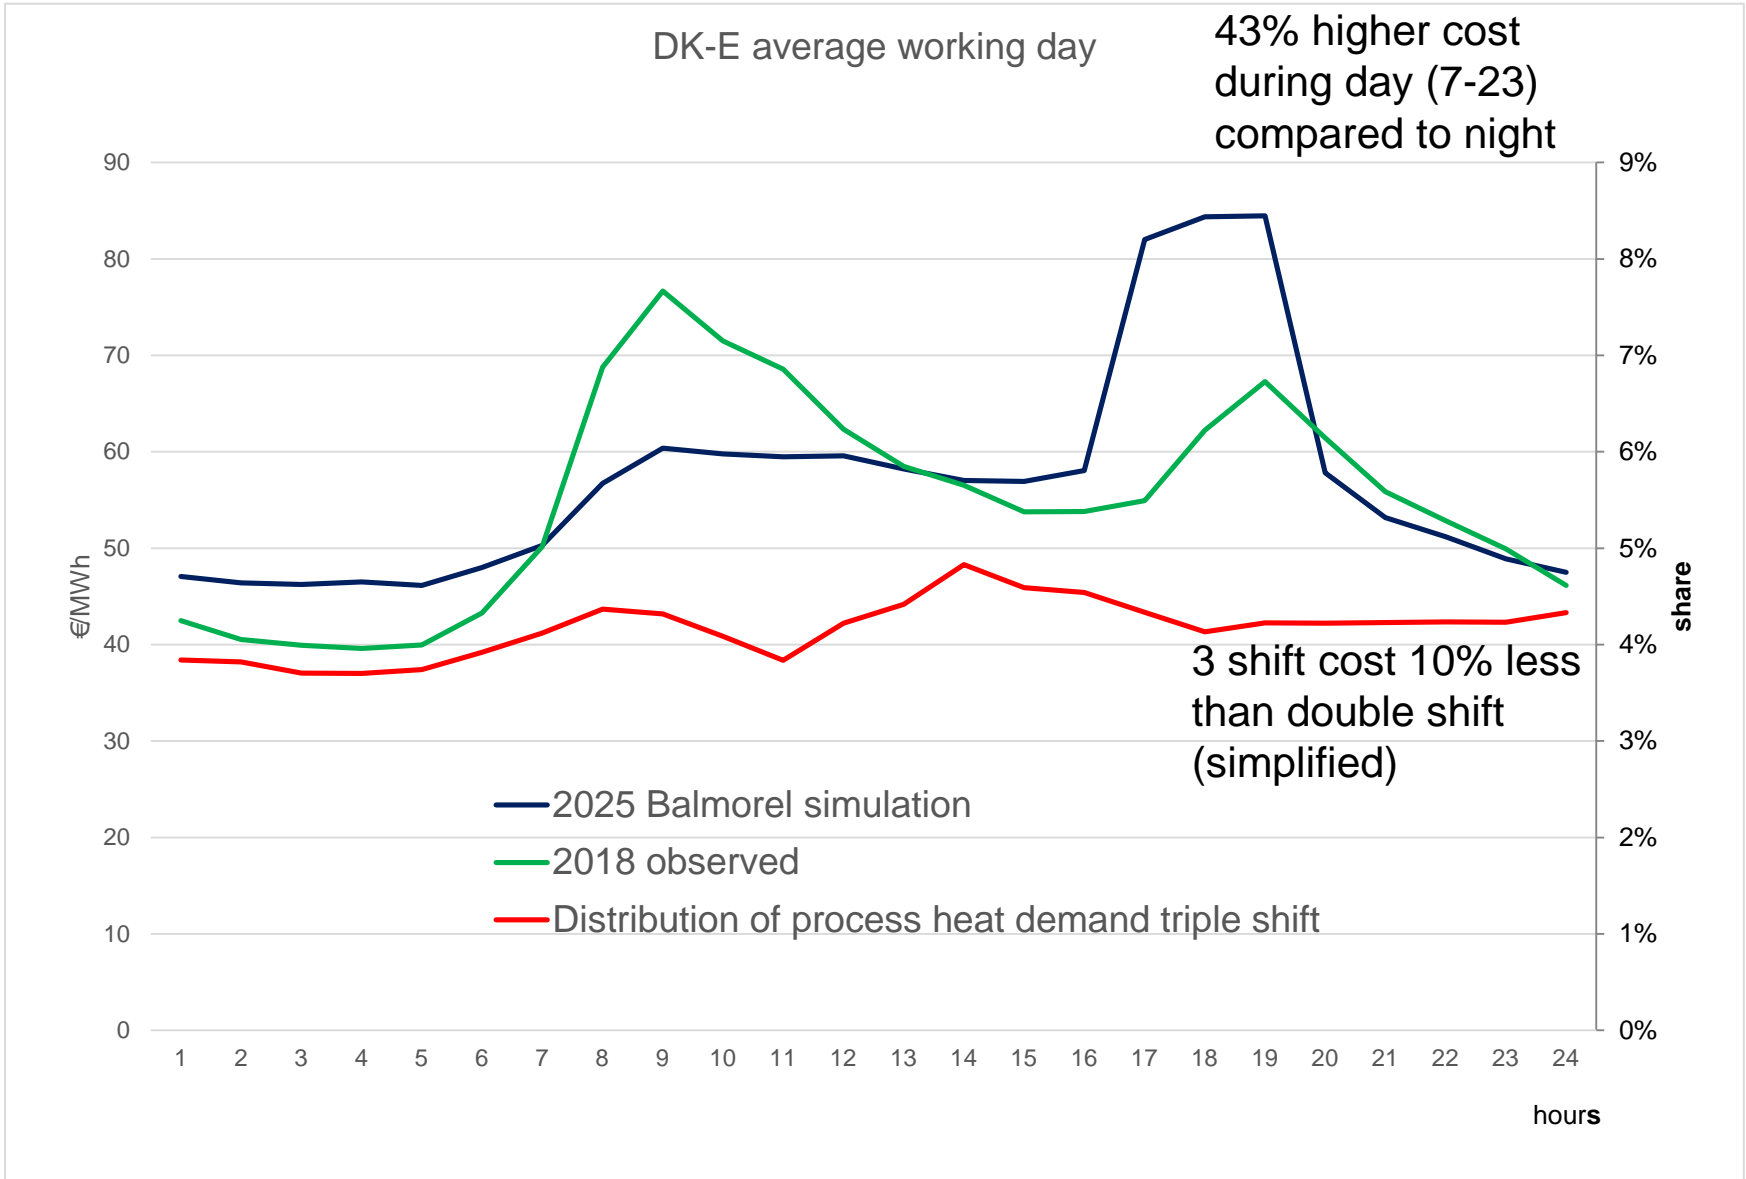

# Electricity price profiles simulated (Balmorel) and actual prices 2018

# Value of savings and cost of electrification (demand)

- Time profile of industrial energy demand and savings varies for sectors
  - Categorising sectors by production/consumption mode in 1-2-3 shift reveals the difference
  - Savings options interact with power system by influencing demand variation – system value of the electricity savings profile is highest for single and double shift industries
  - Power system cost of electrification is highest for single and double shift
- Savings and electrification priority indication
  - Focus on natural gas and electricity savings in single and double shift industries – (highest value)
  - Target electrification to natural gas demand in triple shift industries (lowest cost)

# Value of industrial energy savings and cost of electrification

*Thank you*
